

Armed Forces College of Medicine AFCM

Physiology of adrenal glands (3) By

Dr. Wessam Ezzat

Associate Professor of Physiology , Faculty of Medicine (ASU)

INTENDED LEARNING OBJECTIVES (ILO)

- By the end of this lecture (3), the student will be able to:
- 1- Mention the effects of excess secretion of adrenal androgens.
- 2- Explain the causes and manifestations of primary adrenocortical insufficiency.
- 3- Enumerate a disease state caused by oversecretion of adrenal catecholamines and how to diagnose this disease..

Adrenal sex hormones

Site of release:

Zona reticularis of adrenal cortex.

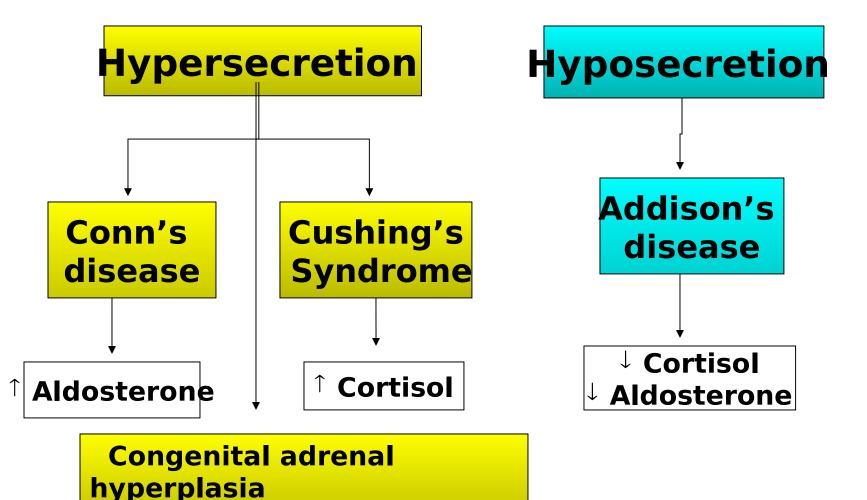

- Their amount is insignificant compared to the amounts secreted by the gonads.
 - 1- Dehydroepiandrosterone (DHEA).
 - 2- Estrogens.

Function:

- Growth of axillary & pubic hair in <u>both</u> of and ? .
 - The onset of puberty (pubertal growth spurt) in **both** ♂ & ♀
- Secretion of the adrenal androgens is controlled by ACTH, <u>NOT</u> by gonadotropins.

Disorders of Adrenal Cortex

= Adrenogenital

syndrome

5

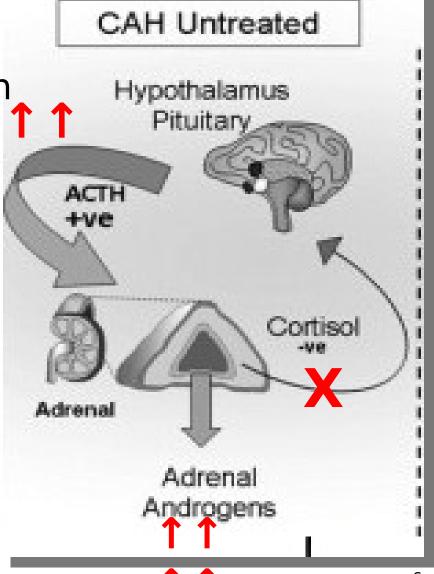

Cause:

 Excess adrenal androgen secretion from Z. reticularis.

 Due to congenital deficiency of some enzymes causing deficient cortisol secretion.

(e.g 21 β hydroxylase enzyme)

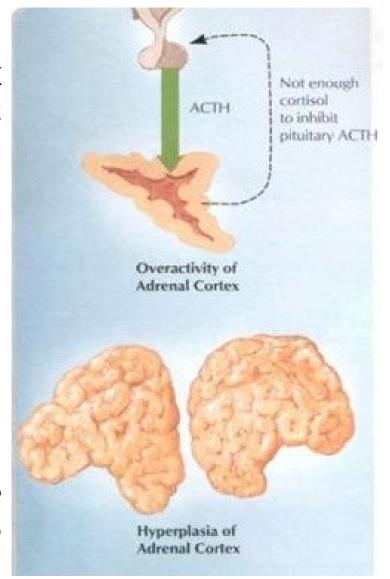

↓ Cortisol

- > removes the -ve feedback on hypothalamus anterior pituitary
- → ↑ ACTH which (+) adrenal cortex
- \rightarrow 1 androgen secretion.
- = (Congenital adrenal hyperplasia).
- The symptoms depend on the <u>age</u> & <u>sex</u> of the individual when hyperactivity begins

eudo-hermaphrod

Growth of external genitalia in a male pattern.

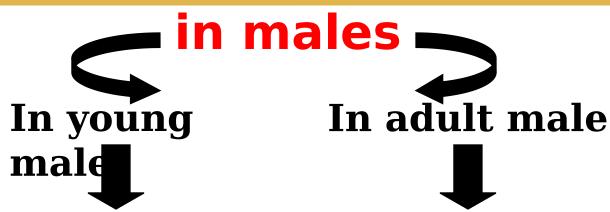

Virilism

Hirsutism, deep voice & increase muscle bulk.

Precocious pseudopuberty

- Early development of 2ry sexual characters without testicular activity and without sperm production.
- e.g deep voice, beard,

 New Mile Medice Denise Module Program

 New Mile Medice Denise Module Module Program

No apparent effect

because of the already existing male sex characteristic.

Disorders of Adrenal Cortex

Adrenocortical insufficiency

• Causes:

I. Primary (Addison's disease) due to:

- Destruction of adrenal gland by auto-immune disease.
- Destruction of adrenal gland by tuberculosis.

II. Secondary due to:

Deficiency of ACTH (pituitary hypofunction)

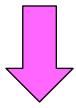

Symptoms of Addison's disease:

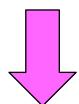

Aldosterone

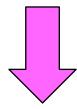

Cortisol

Sex

hormones

Aldosterone

- Hyponatremia (due to Na+ loss).
- Hypotension: why?

Program

- → aldosterone

 hyponatremia.
- ↓ cortisol
 □ ↓ vascular response to CAs.
- If sever hypotension &shock [] Addisonian crisis

- Hyperkalemia [] cardiac arrhythmias.
- Metabolic acidosis (due to H+ retention)

 New Five Year Endocrine & Genitourinary Module

Cortisol

- Hypoglycemia (↓ gluconeogenesis).
- Hypotension.

- Fatigue, malaise, weakness & weight loss.
- Poor response to stress.
- · Anemia.

Sex hormones

 The deficiency of adrenal sex hormones usually has little effect in the presence of normal testes or ovaries.

Collectively,

<u> </u>	Нуро	hyponatremia.
		hypotension.
		□ hypoglycemia.

Hyper	hyperpigmentation.
	□ H +.

Symptoms:

Fatigue, lassitude, malaise, weakness, anorexia

Postural dizziness, syncope

Gastrointestinal Symptoms

- Nausea
- Vomiting
- Abdominal Pain
- Diarrhea
- Constipation

Myalgias, arthralgias,

Signs:

Weight loss

Hyperpigmentation

Hypotension

Thinning of axillary and pubic hair

Hyperpigmentation in Addison's Disease

Addisonian Crisis

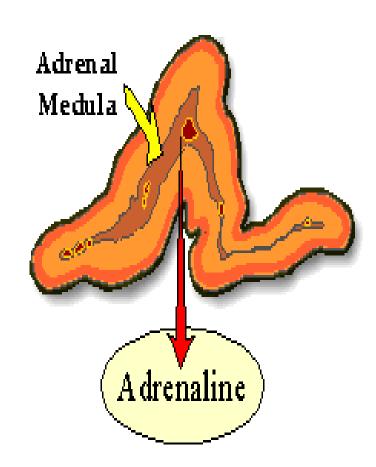

- Exposure to stresses in patients with Addison's disease
- severe hypotension, hypoglycemia, hyperkalemia, severe vomiting and diarrhea and <u>hypovolemic shock</u> even death.
- Other causes:
- Sudden withdrawal of GC.
- Bilateral adrenalectomy.
- Treatment:

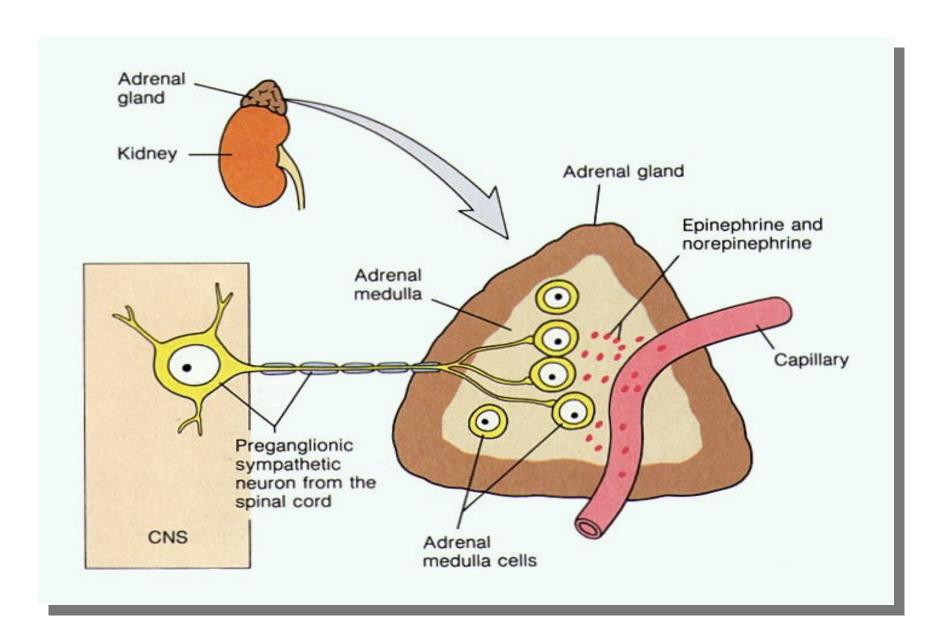

Program

 IV glucocorticoids and isotonic NaCl infusion.
 Endocrine & Genitourinary Module

- Inner part (20%) of the of adrenal gland.
- Modified sympathetic ganglion made up of chromaffin cells.
- Secretes catecholamines into blood.
- 1- Epinephrine. (80%)
- 2- NE. (20%)

During the fight-or-flight responses:

- → (+) of sympathetic nervous system with
- → release of large amounts of catecholamines (mainly epinephrine).
- → Augmentation & Generalization of sympathetic effects.

Kegulatio

n:

Not only fight or flight responses (+) sympathetic input to the gland but different factors can 1 catecholamines secretion, by increasing pregangionic sympathetic impulses to the adrenal medulla.

e.g.:

- Hemorrhage.
- Exposure to cold (hypothermia).
- Severe hypoglycemia.
- Sever exercise.

Actions:

Metabolic effects

- CHO:
- (+) glycogenolysis in liver & muscles ↑ glucose (Hyperglycemic).
- (-) insulin & (+) glucagon.
- Fat:
- (+) HSL

Smooth muscles

- ↑ H.R (+ve choronotropic)
- ↑ force of contraction (+ve inotropic)
- ↑ COP.
- Generalize C.N.S
- ↑ ABP

(+) RAS □ ↑ alertness

Respirato

Bronchodilatation Contraction of sphincters & relaxation of walls of GIT & U.T

PHEOCHROMOCYTOMA

- A tumor of the adrenal medulla that secretes excessive amounts of catecholamines.
- Symptoms: attacks of......
 - Severe hypertension.
 - Hyperglycemia.
 - Palpitations.

Diagnosis:

Measurement of 24-hour <u>VMA</u> (vanillylmandelic acid) in urine.

Lecture Quiz

- Q. Addison's disease is characterized by which one of the following?
- a. Is accompanied by hyperkalemia & hypernatremia.
- b. Is accompanied by hypertension & hyperglycemia.
- c. Is accompanied by skin pigmentation.
- d. Metabolic alkalosis may occur.
- e. Must be associated with obesity.

Lecture Quiz

- Q. Which of the following describes catecholamines?
- (a) are secreted by the adrenal cortex.
- (b) reinforce the parasympathetic nervous system.
- (c) are important in the maintenance of blood pressure.
- (d) promote glycogen storage.
- (e) are secreted in response to hypothalamic stimulation.

SUGGESTED TEXTBOOKS

- 1. Ganong's Review of Medical Physiology, 23rd edition, Chapter 22.
- 2. Guyton & Hall: Textbook of Medical Physiology, 12e (77) [pages: 1696-1732]
